

I am an EMS provider, a MARS Radio operator and a ham radio operator with my degrees in Electronics. For the last 25 years I have been involved in electronics in one form or another. I do not believe with the tests that have been conducted in the amateur community or the comments that have been posed by the NTIA that this docket should have ever made it to this point. It seems glaringly suspicious to myself that you are bowing to a commercial interest when several other countries have stopped their user of BPL.

Stop this now while you can. There are other less intrusive means of providing rural bpl. I live way out in the country and am serviced by a 900 mhz part 15 wireless service that doesnt interfere with emergency services or other HF users.
